## Fluorinated Bioactive Compounds . . . . . 58

# Fluorinating Agents, Building Blocks, Fluorinated Bioactive Compounds

The introduction of fluorine into bioactive molecules often results in significant changes in their chemical, physical, and biological properties. Fluorine uniquely affects the property of organic molecules due to the fluorine atom's blocking effect in metabolic transformations and mimicking of enzyme substrates, and then increases the molecular lipophilicity to enhance bioavailability. Approximately 30% of all agrochemicals and 20% of all pharmaceuticals contain fluorine.<sup>1)</sup> HMG-CoA reductase inhibitor fluorostatin (atorvastatin), antibiotic fluoroquinolone (levofloxacin), and antitumor fluoronucleoside (tegafur) are successful examples of the introduction of fluorine into organic molecules (Fig. 1). Therefore, fluorinating agents are useful tools for the synthesis of pharmaceutical and agricultural compounds.

Fig. 1 Fluorinated bioactive compounds

Since there are few naturally occurring fluorine containing compounds, it is necessary to fluorinate organic compounds at a certain stage of the syntheses. Though fluorine gas and hydrogen fluoride are used as fluorine sources, they are very toxic and corrosive and require special equipment and techniques for handling them. Therefore, alternate fluorinating agents have been developed, which are used in laboratories to easily introduce a fluorine atom at selected positions of the compounds. The fluorinating agents are roughly classified into two categories: nucleophilic and electrophilic. Nucleophilic fluorinating agents are those where the fluoride anion serves as a reaction active species. Electrophilic fluorinating agents are those where the electron-deficient fluorine atom serves as a reaction active species. In addition, a fluorinated building block is used as a fluorine source, which has both a fluorine atom and a replaceable functional group in a molecule.

## 1. Nucleophilic Fluorinating Agents

The most basic nucleophilic fluorinating agent is hydrogen fluoride which is used in large quantity for the industrial production of fluorinated compounds. Hydrogen fluoride, however, is scarcely used in laboratories due to its toxic and corrosive properties and its low reactivity resulting from high H-F bond energy. Nucleophilic fluorinating agents such as KF, CsF, and Bu<sub>4</sub>N • F are readily available. These fluorinating agents are hygroscopic, and unfortunately the moisture in these substances forms strong hydrogen bonds with the fluoride anion and this leads to decrease in reactivity. "Naked" fluoride anions, where

the fluoride anion is completely free of hydrogen bonds, have been developed. For example, tetrabutylammonium difluorotriphenylstannate (**T1592**), which was reported by Gingras as an alternative reagent to Bu<sub>4</sub>N • F, is non hygroscopic with excellent stability to heat and high solubility in organic solvents.<sup>2)</sup> Martines *et al.* synthesized *gem*-fluoro-triflate from aldehyde using **T1592**.<sup>3)</sup>

DAST (**D1868**) is used in a wide variety of synthetic processes for stereospecifically substituting a fluorine atom for a hydroxyl group.<sup>4)</sup> Kozikowski *et al.* have developed the method of producing (-)-fluoro-*myo*-inositol from quebrachitol in two stages.<sup>5)</sup> They reported that in this method, **D1868** reacts with either of two axial hydroxyl groups of a quebrachitol to form a DAST intermediate which greatly increases the leaving ability of the hydroxyl group. This enables an easy nucleophilic displacement of the hydroxyl group by the fluoride anion accompanied with steric inversion. **D1868** is unstable to heat, and is drastically decomposed by heating. However, in general, the reactions using **D1868** are completed in a short time at room temperature or lower temperature.

Lal *et al.* have reported DAST analog (**B2440**), which is much more thermally stable than DAST.<sup>6)</sup> The reactivity of **B2440** is comparable to DAST, and in some substrates, superior to DAST. **B2440** has much attention as a useful fluorinating agent with its thermal stability and reactivity.

4-*tert*-Butyl-2,6-dimethylphenylsulfur trifluoride (FLUOLEAD™) (**B3664**), which was first reported by Umemoto, is a novel nucleophilic fluorinating agent.<sup>7)</sup> **B3664** is a white crystalline solid with high thermal stability, which has a 232 °C thermal decomposition temperature (by DSC analysis). Differing from

other existing fluorinating agents, such as DAST, **B3664** has less fuming character. And the reactivity of **B3664** to water is slow, which makes it easier to handle in open air.

Fluorinations of a hydroxyl or carbonyl group by **B3664** afford the corresponding fluorinated compounds in good yields under a wide range of conditions (0 to 100 °C).

Unlike other fluorinating agents, **B3664** can convert carboxyl groups (-COOH) to trifluoromethyl groups (-CF<sub>3</sub>) in good yields. Furthermore, thioketones or thioesters can be fluorinated by **B3664**. Thus, **B3664** is a useful fluorinating agent widely applicable to various substrates, and can be an alternative to other fluorinating agents.

Another method for facilitating the attack of fluoride anions is achieved by producing carbocations. Carbocations can be produced by oxidation of organic compounds. Consequently, the combined use of an oxidizing agent and a fluorinating agent enables easy fluorination. In addition, selective fluorination becomes possible by selecting an oxidizing agent. Kuroboshi *et al.* have achieved the synthesis of fluoroiodoalkanes from olefins using tetrabutylammonium dihydrogentrifluoride (**T1635**) and NIS as oxidizing agent.<sup>8)</sup>

Electrolytic oxidation is also available as a means of oxidation of organic compounds. Purification of the target compound can be done easily by this method because of simple reaction system without use of oxidizing agents.

## 2. Electrophilic Fluorinating Agents

The basic agent among electrophilic fluorinating agents is fluorine gas, which is not suitable for partial fluorination due to its

vigorous reactivity and strong toxicity. Umemoto *et al.* reported that *N*-fluoro-pyridinium salt (**a**, **b**, **c**), which is a stable and easy-to-handle crystal, has high reactivity.<sup>9)</sup> The fluorinating ability can be increased or decreased by introducing electron withdrawing groups or electron donating groups into the pyridine ring. For example, the fluorinating ability increases in the order of **a**, **b** and **c** of the structures shown below. Suppression of side reactions and improvement in yield are possible by selecting an adequately reactive agent for the situation.

Fig.2 Electrophilic fluorinating agents

*N*-Fluoro-*N*-(chloromethyl)triethylenediamine bis(tetrafluoroborate) (**F0358**) is an easily handled powder and versatile electrophilic fluorinating agent for enols, silyl enol ethers, alkenes, stabilized carbanions, aromatic compounds, organosulfur compounds, Grignard agents, *etc.*<sup>10)</sup>

*N*-Fluorobenzenesulfonimide (**F0335**) is also an easily handled and stable crystalline electrophilic fluorinating agent for enolates, silyl enol ethers, aromatic compounds, organolithium compounds, alkyl phosphate carbanions, *etc.*<sup>11)</sup>

## 3. Fluorinated Building Blocks

Recently, fluorinated building blocks having both a fluorine atom and substitutable functional group are being used as an easily available fluorine source. In particular, compounds containing a fluorine atom and an electron withdrawing group on the same carbon atom are used as effective fluorinated building

blocks to synthesize physiologically active compounds. This type of compound is treated with base to form fluoro-carbanions which react with electrophiles. For example, triethyl 2-fluoro-2-phosphonoacetate (**F0340**)<sup>12</sup> produces a fluoro-carbanion in the presence of base. Horner-Emmons reaction of the anions with carbonyl compounds produces  $\alpha$ -fluoro- $\alpha,\beta$ -unsaturated esters. These esters can be reduced into aldehydes and alcohols, and are very useful intermediates to many physiologically active compounds. Synthetic compounds such as vitamin A derivatives<sup>13</sup>, insect sex pheromones<sup>14</sup>, and pyrethroid<sup>15</sup> with insecticidal action are major examples of fluorinated physiologically-active compounds produced with **F0340**.

Piva observed that  $\alpha$ -fluoro- $\alpha,\beta$ -unsaturated esters can be converted into  $\alpha$ -fluoro- $\beta,\gamma$ -unsaturated esters in the presence of base by irradiation with 254 nm light. If an optically active amine is used as a base, either of the optical antipodes can be preferentially obtained.<sup>16</sup>

Fluoromethyl phenyl sulfone (**F0341**), having both a fluorine atom and a sulfonyl group on the same carbon atom, produces fluoro-carbanions in the presence of base.<sup>17</sup> These anions react with carbonyl compounds to form  $\alpha$ -fluoro- $\beta$ -hydroxyphenyl sulfone derivatives. This sulfone can be converted into  $\alpha$ -fluoro- $\alpha,\beta$ -unsaturated sulfone and fluoro-vinyl derivatives. McCarthy *et al.* reported the method of stereoselectively introducing fluoro-methylene units into a nucleoside using **F0341**.<sup>18</sup>

1-Fluorovinylsilane (**F0518**) reacts with aryl halides in the presence of fluoro anion and a catalytic amount of CuI, Pd catalysts to afford the corresponding (1-fluorovinyl)arenes.<sup>19</sup> This reaction proceeds via transmetalation of the 1-fluorovinyl group under mild conditions and affords the reaction products in high yields. In addition, **F0518** reacts with aldehydes to give the corresponding monofluoroaryl alcohols in good yields.<sup>20</sup>

Ethyl bromofluoroacetate (**B1673**), having a fluorine atom, a bromine atom, and a carboxyl group on the same carbon atom, reacts with zinc to form Reformatsky reagent. This Reformatsky reagent reacts with carbonyl compounds to form  $\alpha$ -fluoro- $\beta$ -hydroxy esters,<sup>21</sup> and reacts with *N*-( $\alpha$ -aminoalkyl)benzotriazoles to form  $\alpha$ -fluoro- $\beta$ -amino esters.<sup>22</sup> Takeuchi *et al.* synthesized an *N*-protected  $\alpha$ -fluoro- $\alpha$ -amino ester using **B1673**, and reported the details of its chemical properties.<sup>23</sup>

The fluorinating agents and fluorinated building blocks described here require only normal methods of organic synthesis. Special equipment and techniques are not necessary to produce fluorinated organic compounds. These fluorinating agents and fluorinated building blocks have already been successfully used to produce a number of medicinal and agricultural chemicals.

# Fluorinated Building Blocks

## Monofluoro Aromatic Compounds

### Monosubstituted (ortho-) Monofluorobenzenes

A1451 25g

2-Amino-5-chloro-2'-fluorobenzophenone  
[784-38-3]

B0883 25g 100g 500g

2-Bromofluorobenzene  
[1072-85-1]

B5104 5g 25g

2-Bromo-2'-fluoroacetophenone  
[655-15-2]

C0647 10g 25g

1-Chloro-2-fluorobenzene  
[348-51-6]

C2710 5g 25g

Cyclopropyl 2-Fluorobenzyl Ketone  
[150322-73-9]

D1796 5g 25g

2,4'-Difluorobenzophenone  
[342-25-6]

E0654 5g

1-Ethynyl-2-fluorobenzene  
[766-49-4]

E1097 5g 25g

Ethyl (2-Fluorobenzoyl)acetate  
[1479-24-9]

F0032 25g 100g 500g

2-Fluoroaniline [348-54-9]

F0035 25g 500g

2-Fluorobenzoic Acid  
[445-29-4]

F0039 25mL 500mL

2-Fluorotoluene [95-52-3]

F0104 25g 100g 500g

2-Fluoronitrobenzene  
[1493-27-2]

F0150 25g 250g

2-Fluorophenol [367-12-4]

F0170 1g 5g

2-Fluoro-DL-phenylalanine  
[2629-55-2]

F0190 25mL 250mL

2-Fluorobenzaldehyde  
[446-52-6]

F0195 25g 100g 500g

2-Fluorobenzoyl Chloride  
[393-52-2]

F0205 5g 25g

2-Fluorophenylacetic Acid  
[451-82-1]

F0209 5g 25g

2-Fluorobenzyl Bromide  
[446-48-0]

F0211 5g 25g

2-Fluorobenzyl Chloride  
[345-35-7]

F0220 25g

2-Fluorobenzonitrile  
[394-47-8]

F0230 10mL 25mL

2-Fluoroanisole [321-28-8]

F0236 100mg 1g

3-(2-Fluorophenoxy)benzyl Bromide  
[242812-04-0]

F0241 25g 500g

Methyl 2-Fluorobenzoate  
[394-35-4]

F0248 5g

2-Fluorocinnamic Acid  
[451-69-4]

F0253 10g 25g

1-Fluoro-2-iodobenzene  
[348-52-7]

F0257 25g

2-Fluorobenzyl Cyanide  
[326-62-5]

F0259 5g 25g

2-Fluorobenzyl Alcohol  
[446-51-5]

F0265 5g 25g

2-Fluorobiphenyl [321-60-8]

F0273 100mg 1g

2-Fluoro-L-phenylalanine  
[19883-78-4]

F0278 10g

2-Fluorobenzamide  
[445-28-3]

F0290 25g

2-Fluorobenzotrichloride  
[488-98-2]

F0291 5g 25g

1-(2-Fluorophenyl)-piperazine Hydrochloride  
[1011-16-1]

F0364 5g 25g

2'-Fluoroacetophenone  
[445-27-2]

F0368 1g 5g

2-Fluorophenylhydrazine Hydrochloride  
[2924-15-4]

F0375 5g

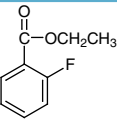

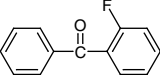

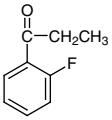

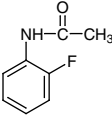

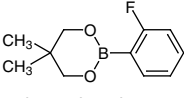

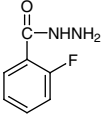

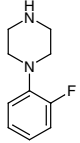

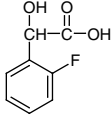

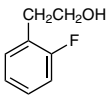

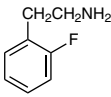

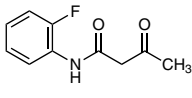

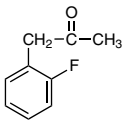

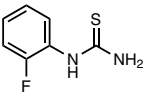

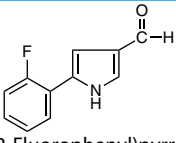

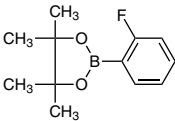

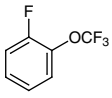

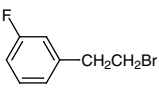

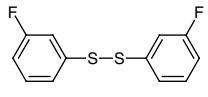

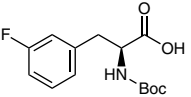

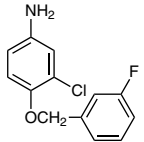

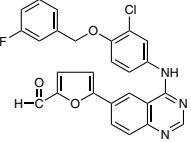

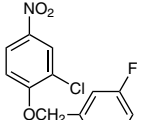

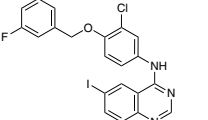

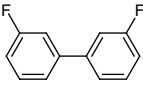

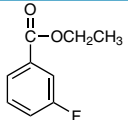

*m*-(2-Fluorophenoxy)-toluene  
[78850-78-9]

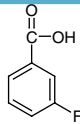

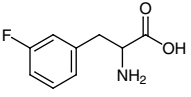

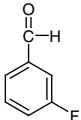

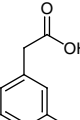

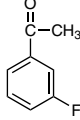

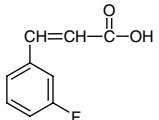

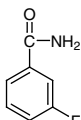

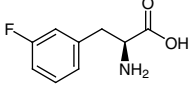

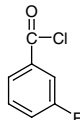

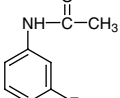

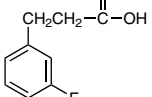

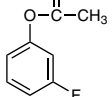

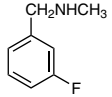

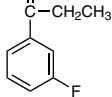

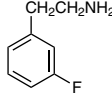

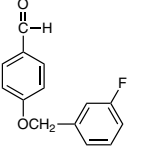

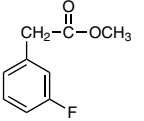

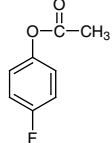

F0389 5g 25g

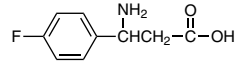

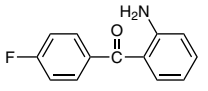

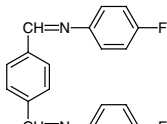

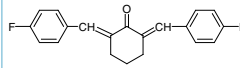

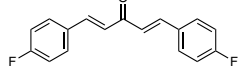

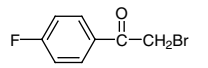

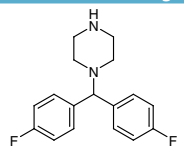

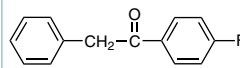

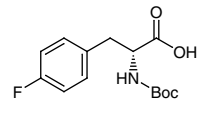

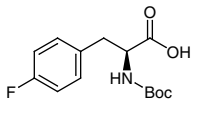

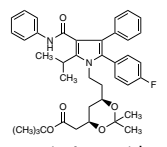

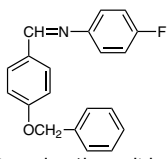

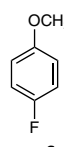

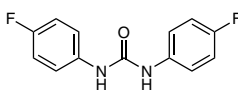

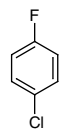

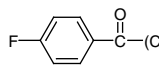

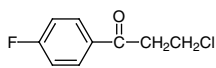

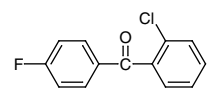

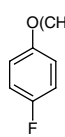

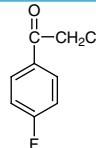

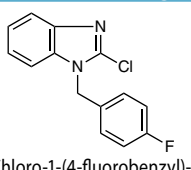

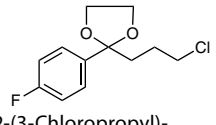

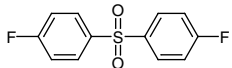

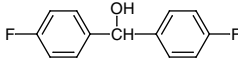

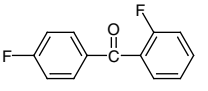

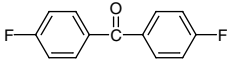

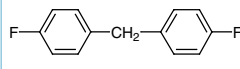

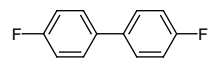

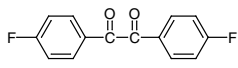

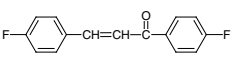

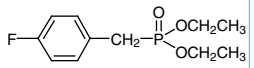

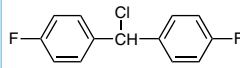

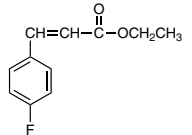

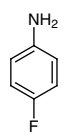

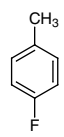

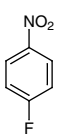

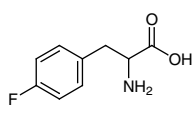

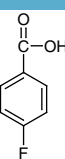

2-Fluorobenzotrifluoride  
[392-85-8]
